

Supplementary Figures

Supplementary Fig 1. PapH anchors P pili to the cell membrane and truncates pilus growth. *E.coli* producing the following P pili constructs were visualized by negative-stain electron microscopy: (A) wild-type P pili (B) *papH* deleted pili (C) *papH* overexpressed pili (D) *papH-Ntd1* complemented pili (E) *papH-HA* complemented pili. Scale bar equals 400nm.
